## 1 Template Optimal Control Problem

$$\text{minimize} \quad \sum_{t=1}^N \frac{1}{2} x_t^\top Q_t x_t + q_t^\top x_t + \frac{1}{2} u_t^\top R_t u_t + r_t^\top u_t, \quad (1a)$$

$$\text{subject to} \quad x_{t+1} = A_t x_t + B_t^- u_t + B_{t+1}^+ u_{t+1} + c_t, \quad t = 1, \dots, N-1, \quad (1b)$$

$$x_t \in \mathbb{D}_t^x, \quad u_t \in \mathbb{D}_t^u, \quad t = 1, \dots, N, \quad (1c)$$

$$F_t^0 x_t + G_t^0 u_t + g_t^0 = 0, \quad t = 1, \dots, N, \quad (1d)$$

$$F_t^1 x_t + G_t^1 u_t + g_t^1 \geq 0, \quad t = 1, \dots, N. \quad (1e)$$

To track known state reference  $x_t^{\text{ref}}$  and/or a control reference  $u_t^{\text{ref}}$ , choose  $q_t = -2x_t^{\text{ref}}$  and  $r_t = -2u_t^{\text{ref}}$ . The boundary conditions on states and control are accounted in  $\mathbb{D}_1^x, \mathbb{D}_N^x, \mathbb{D}_1^u$ , and  $\mathbb{D}_N^u$ .

## 2 Conic Optimization Problem

The optimal control problem (1) falls in the class of conic optimization problems represented by (2), where the convex set  $\mathbb{D}$  and convex cone  $\mathbb{K}$  are easy to project onto (potentially with closed form expressions).

$$\begin{aligned} & \underset{z}{\text{minimize}} \quad \frac{1}{2} z^\top P z + p^\top z \\ & \text{subject to} \quad H z + h \in \mathbb{K}, \\ & \quad \quad \quad z \in \mathbb{D}. \end{aligned}$$

## 3 Extrapolated PIPG (xPIPG)

The step sizes  $\alpha$  and  $\beta$  are dependent on the maximum eigenvalues of  $P$  and  $H^\top H$ . Note that  $\|Q\|$  denotes its maximum eigenvalue if  $Q$  is a square matrix, and it denotes its maximum singular value if  $Q$  is a non-square matrix.

$$\alpha = \frac{2}{\sqrt{\|P\|^2 + 4\omega\|H\|^2 + \|P\|}}, \quad (3a)$$

$$\beta = \omega\alpha. \quad (3b)$$

## 5 Customization of xPIPG to Template OCP

The notation  $a_{1:M}$  in Algorithm 2 denotes the collection of vectors  $a_t$ , for  $t = 1 \dots, M$ , arranged into a 2D array.
